

IN THE CLAIMS

1. (*Original*) A solenoid actuator for linearly actuating a device,

 comprising:

a) a primary pole piece having a first annular portion;

b) a secondary pole piece having an outer axial face oriented away from
5 said device and a second annular portion, said second portion being axially
separated from said first portion to form an air gap therebetween; and

c) an armature disposed for slidable axial motion within said first and
second annular portions, said armature having a side wall terminating in a
leading face oriented toward said device and a trailing face oriented away from
10 said device, wherein said leading face and said trailing face are each
substantially orthogonal to the direction of said axial motion, and wherein said
trailing face remains outside said secondary pole piece at all axial positions of
said armature.

2. (*Original*) A solenoid actuator in accordance with Claim 1 wherein said
first annular portion of said primary pole piece is tapered.

3. (*Original*) A solenoid actuator in accordance with Claim 1 where in said second annular portion of said secondary pole piece is tapered.

4. (*Original*) A poppet valve assembly for proportionally controlling flow of a fluid, the assembly including a solenoid actuator comprising:

a) a primary pole piece having a first annular portion;

A/
5 b) a secondary pole piece having an outer axial face oriented away from said device and a second annular portion, said second portion being axially separated from said first portion to form an air gap therebetween; and

c) an armature disposed for slidable axial motion within said first and second annular portions, said armature having a side wall terminating in a leading face oriented toward said device and a trailing face oriented away from
10 said device, wherein said leading face and said trailing face are each substantially orthogonal to the direction of said axial motion, and wherein said trailing face remains outside said secondary pole piece at all axial positions of said armature.

8
5. (Original) A poppet valve assembly in accordance with Claim 4 wherein said assembly is an exhaust gas recirculation valve and wherein said fluid is exhaust gas from an internal combustion engine.

Please add claim 6 as follows:

6. (New) A poppet valve assembly for proportionally controlling flow of a fluid, the assembly including a solenoid actuator comprising:

a) a primary pole piece having a first annular portion;

AR 5 b) a secondary pole piece having an outer axial face oriented away from said device and a second annular portion, said second portion being axially separated from said first portion to form an air gap therebetween;

c) an armature disposed for slidable axial motion within said first and second annular portions, said armature having a side wall terminating in a leading face oriented toward said device and a trailing face oriented away from said device, wherein said leading face and said trailing face are each substantially orthogonal to the direction of said axial motion, and wherein said trailing face remains outside said secondary pole piece at all axial positions of said armature; and

42

d) a pintle carried by said armature, said pintle extending through an axial
15 bore in each of said primary pole piece and said secondary pole piece.
